State Partnership for  
Energy Efficient Demonstrations

# California Institute for Energy and the Environment (CIEE)

An innovative University of California partnership of energy agencies, utilities, building industry, non-profits, and research entities designed to advance energy efficiency science and technology for the benefit of California and other energy consumers and the environment. CIEE is a branch of the University of California Energy Institute.

# SPEED Market Impact

## Develop

### Market-Based Solutions

Partnering to innovate cutting-edge energy-efficient technologies

## Demonstrate

### Effectiveness & Viability

Validating performance & economics to educate and overcome barriers

## Deploy

### Into the Mainstream

Influencing market penetration to achieve deep energy efficiency potential

Product Improvements & Derivatives

# 2013 Title 24 changes the baseline from the 2008 baseline for 2014 IOU Incentives.

***Examples of how the 2013 Title 24 Code will change the baseline for IOU incentives in 2014 and SPEED best practices for exceeding the 2013 Title 24***

State Partnership for  
Energy Efficient Demonstrations

# What is changing in 2013 Title 24?

- **Exterior**
  - Sensors on all exterior luminaires mounted under 24'
- **Interior**
  - Sensors required in secondary spaces (which spaces)
  - Daylighting required in spaces (which spaces)
  - Dimmable ballasts required (which spaces?)
- **Compliance retrofit threshold reduced**
  - 10% of all luminaires or 40 ballasts

# **Good News - Bad News**

- 1. The SPEED program demonstration work supported the 2013 Title 24 changes**
- 2. IOU incentives require energy efficiency projects that exceed current Title 24 requirements**
- 3. SPEED Technologies and other Best Practices still save up to 78% above the 2013 Title 24**

# ***Parking Garage Incentive Changes***

<b>Lighting Technology</b>	<b>% Energy Savings over 2013 T24</b>	<b>2008 Incentive</b>	<b>2013 Incentive</b>	<b>Incentive Lost</b>
LED Parking Garage Luminaire	0%	\$164	\$0	\$164
LED Parking Garage Luminaire (50% Low Mode)	0%	\$222	\$0	\$222

Ambient Troffer with Networked Controls (20% Low)	40%	\$75	\$28	\$47
LED Ambient Troffer with Networked Controls (20% Low)	71%	\$97	\$50	\$47

# ADAPTIVE CORRIDOR LIGHTING

Large-scale retrofits yield large-scale energy savings

## CONTROL OPTIONS FOR ADAPTIVE CORRIDOR LIGHTING

Facility managers have a variety of choices when selecting light sources and controls, and cost-effective solutions are available to fit most campuses' needs. The incumbent example used for this business case study is the most common type of campus corridor fixture: a 2-lamp 2x4 T8 recessed fluorescent fixture. The four retrofit scenarios described here represent just some of the options commercially available today.

*NOTE: To produce realistic calculations for the four scenarios presented here, the SPEED team selected specific, commercially available solutions. Scenario 1 implements a microwave occupancy sensor and bi-level ballast into each existing luminaire. Scenario 2 involves installing 0–10V dimming ballasts and a Lutron semi-wireless control system. Scenario 3 utilizes 0–10V dimming ballasts and an Enlighted wireless control system. Scenario 4 is based on Finelite's High-Performance Recessed (HPR) 2x4 LED fixture and the same Lutron control system used for scenario 3. Other manufacturers offer similar solutions.*

## SCENARIO 3 – NETWORKED 64% ENERGY SAVINGS

Networked lighting systems offer the most sophisticated level of lighting control. They require dimming ballasts, occupancy sensors and networked controls, a gateway, and a Web interface. The wireless gateway communicates with the other parts of the system and connects the system as a whole with the Internet, allowing control access from any location via the Web interface. Facility personnel can monitor energy use, adjust light levels and program fixtures based on occupancy, multiple predetermined schedules, predictive pathing, and demand response (DR) events. DR capability allows facilities to take advantage of utility incentives associated with DR program participation.

## SCENARIO 4 – NETWORKED + LED 82% ENERGY SAVINGS

For maximum lighting efficiency, facilities can install LED fixtures with dimmable drivers along with the network control components described in Scenario 3. The networked control system also allows for dynamic adjustment of light levels based on occupancy.

# A Digital World Needs DC Power ... so .... What's AC got to do with it?

## PROBLEM: **MISMATCHED AC & DC POWER REQUIREMENTS**

### ENERGY SOURCES – MIXED AC & DC

### ELECTRIC DEVICES – TYPICALLY DC

## RESULT: **LOST OPPORTUNITY TO REDUCE ENERGY UP TO 30%**

# DC THE BRIDGE TO ZNE ?

According to:

***SERA Architects (leaders of the Living Buildings Challenge), USGBC, NBI, Architecture 2030, studies from the CEC, and reports from the US DOE, LBNL...***

Energy Efficiency can cost-effectively be increased by 50-80%

Of an average building's demand, on-site renewables can generate 10-30%

Thus, the remaining 10% will be a crucial gap to ZNE

**DC CAN  
IMPROVE SYSTEM EFFICIENCY  
BY 10-35%**
